

Case Study

Oracle Live Experience

Live Experience, Business Goal

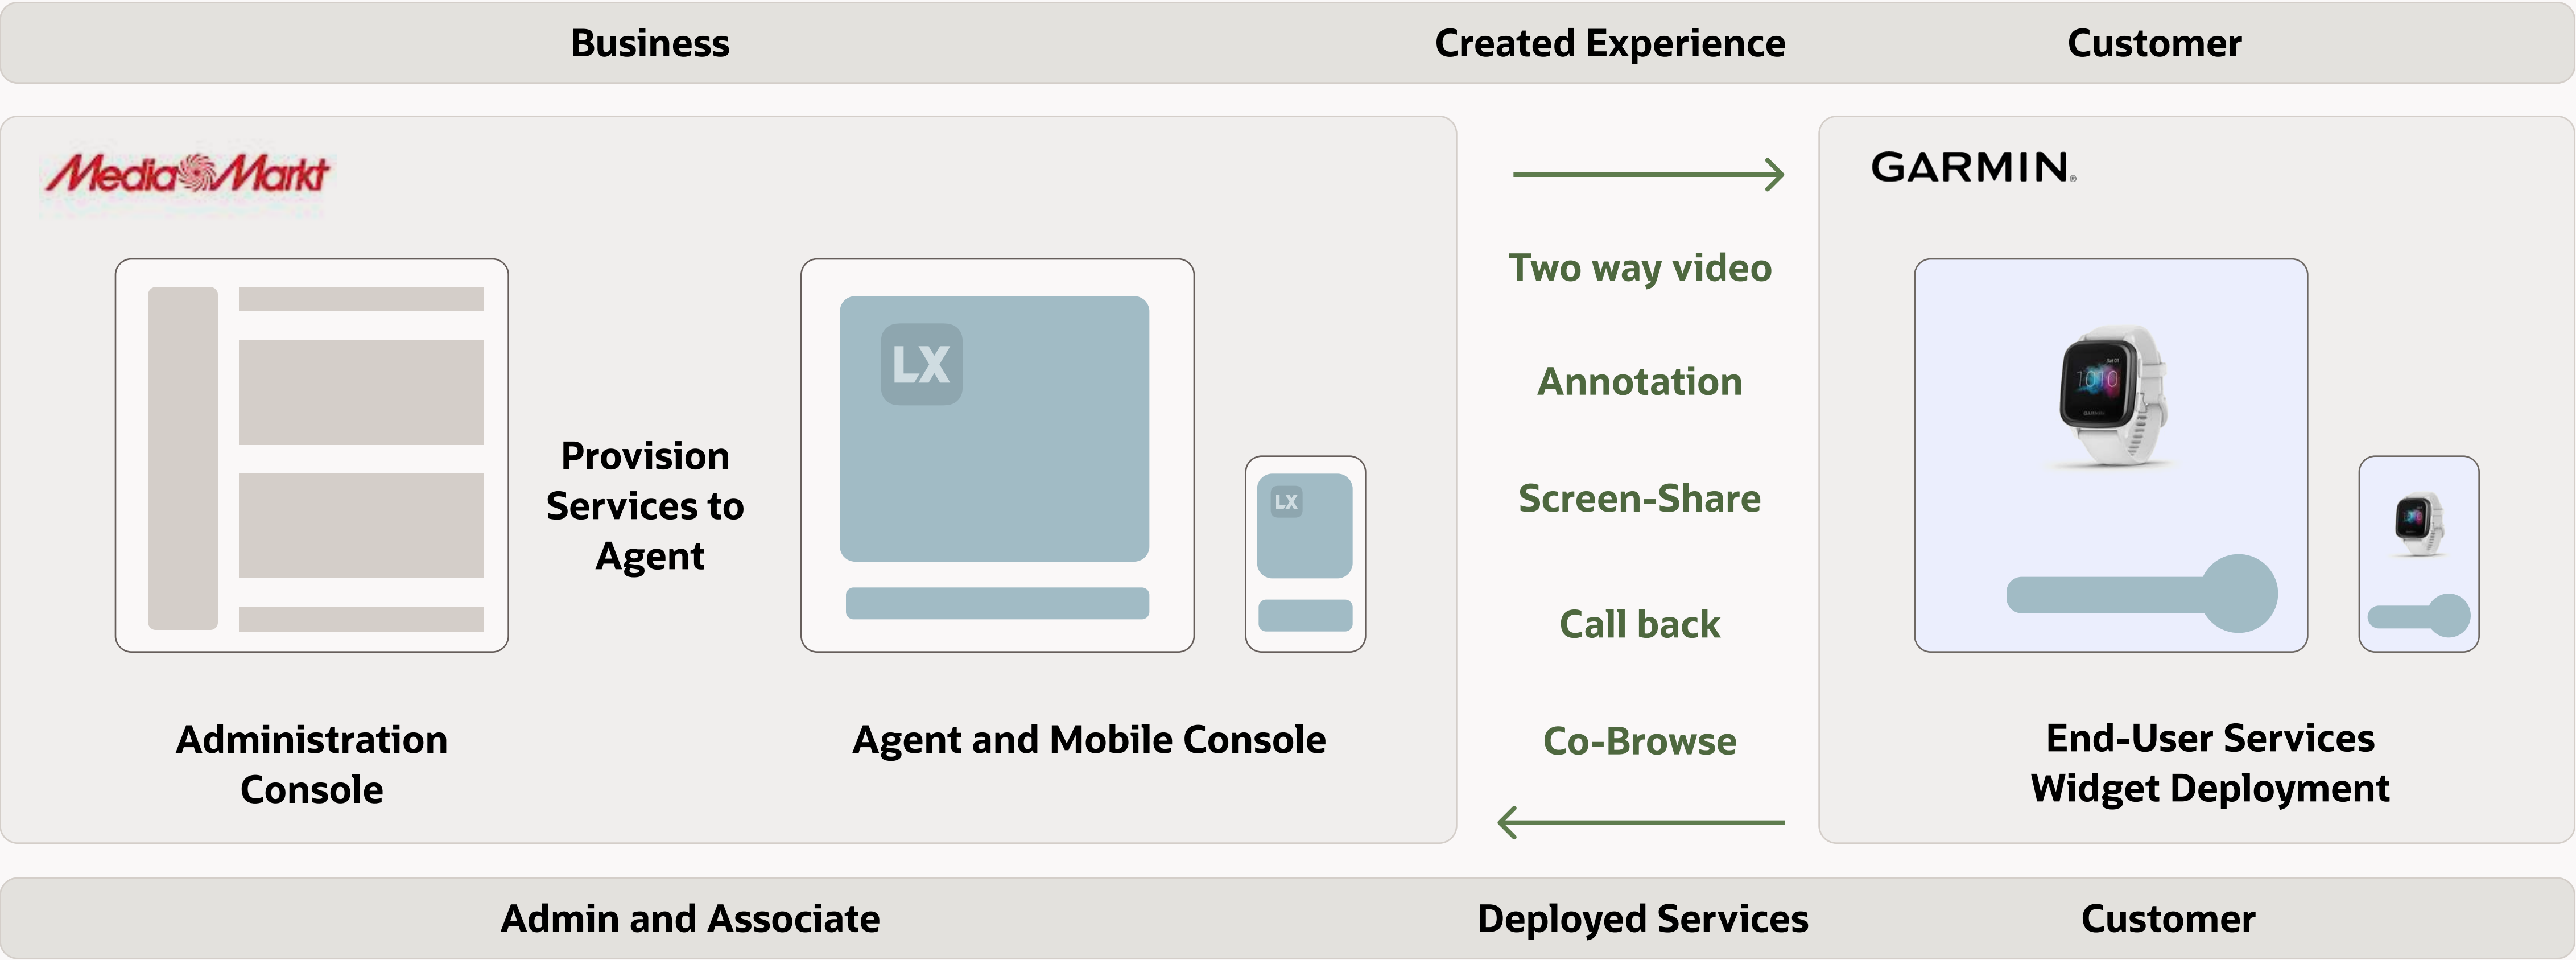

Live Experience helps your **customers** connect with the **business** in a modern and proactive way, using their tablets and mobile devices.

The product comes with prebuilt engagement templates for your business needs. Live Experience's visual engagement tools like **two-way video**, **screen sharing**, **co-browsing**, and **annotation** help to quickly resolve customer support issues.

The native apps are available on the Google **play store** and iOS **app store**.

Sponser Users: **MediaMarkt, TelKomTelstra**

Admin Interface

Starting the Engagement

Select the start-up experience you want to give your customers.

Tap and wait for an associate

☒ Customers wait in a call queue and are connected with the first available associate.

Tap and register for a callback

☐ Customers are prompted to register for a callback.

Tap and read out a short code

☐ Customers are shown a six-character code, which they provide to the associate they want to connect with.

Join by URL

☐ Customers are sent a URL to join an engagement with a specific associate.

Enable ID Verification

☐ Verify Customer Identity and connect to the associate.

General Options

Use External Audio

☒ On

Allow Callback

☒ On

Co-Browse Screen Sharing

☒ On

Upgrade Channel Configuration

☒ On

(In Future)

☒ On

Allow channel upgrade option, for the engagement scenario supporting Call Transfer and Add Participant.

Customer Experience

Understanding the Interfaces

Customer Interface for ios and android platform...

Desktop Agent but currently supports mobile android platform...

My Role - Experience Design and Support Product Design

- Lead the design experience for the **monthly releases**, this was critical to add new features and focus on bug fixes.
- Maintain the design sprints stories and wear a **Product Manager Hat** to guide the development team with “dev” issues and feature understanding.
- Maintain the Live Experience **legacy design system** and keep adding the components with the new feature releases.
- Work closely with the **quality assurance team** to test the product and ensure bug fixes for accessibility, audio, videos and component design.

My Journey - Solving Key Challenges

- Development teams **across the globe**, NZ, UK, China and India, working distinctly on different versions of the application for Web, iOS and Android.
- The product manager relied on me gradually for taking the base level stories and converting them to **full-fledged stories**, and support the releases.
- Working closely with the **distinct development teams** and testing team to see that all the versions, across the platform, have similar experiences.
- Deliver **quick** on **monthly sprints** and also focus on the Unity Data Platform product.

Product Management Design Requirements

© 2006 The Authors

The diagram illustrates three states of a video player UI:

- Pressed State:** Shows a vertical stack of three icons (video, audio, and a red icon) on the left, and a horizontal row of five icons (three dots, pause, speaker, microphone, and a red icon) on the right. A video thumbnail is shown on the far right.
- Default State:** Shows a horizontal row of five icons (three dots, pause, speaker, microphone, and a red icon) on the left, and a video thumbnail on the right.
- Disabled State:** Shows a horizontal row of five icons (three dots, pause, speaker, microphone, and a red icon) on the left, and a video thumbnail on the right. The icons are faded.

Epics broken down to MVP releases and Instructions.

Define what the end-user and associates see and the channels they can use:

End-User and Associate Experience

- When the engagement scenario is **audio at both sides** the *ellipse icon* will not be visible on the panel as these are not required at this stage.

- When the engagement scenario is set to the (one-way video) **video at the customer side and audio at the associate side** the *ellipse icon* will not be visible on the panel as the only camera icon is required at this stage.

- When the engagement scenario is set to **Screen Share at the customer side and audio at the associate side** the *ellipse icon* will be visible on the panel for Web and Mobile Widget and will display **Screen Share + Annotate Icon for Web Widget** and **Screen Share + Spotlight for the mobile widget**.

Press and Click:

- On a **soft press**, the *ellipse icon* will make the option visible on the mobile widget, similarly, **on a click**, the *ellipse icon* will display on the desktop widget.

Detailed visual instructions.

@Sandeep Virmani

I don't see any mocks about the full screen status. Should we also show the volumn button (speaker icon) and mute button (microphone icon) in full screen status? Or we just keep the buttons in full screen no change? One thing should be notice, in freeze annotation status, we only show pause and exit buttons.

Xiaohong Si

@Sandeep Virmani

When we hide the button bar by clicking the avatar, for video call, it shows the video icon in the bottom-right cornor of the avatar, but in the mocks, if it is only shows mute icon, how do we show it's a video call? Or I think the mute takes high priority according the mocks, if it's mute, we just show the mute icon and ignore the call type (video, audio), am I right?

@Xiaohong Si

Clarified with Richard

- If we are on Camera and Mute > We show two icons on Avatar Camera and Mute (Matt is working on this)
- If we are on ScreenShare and Mute > We show two icons on Avatar Screen-share and Mute (Matt is working on this)
- Is we are on Audio Call and on Mute > We show a single icon for Mute which is there in the mocks.
- All the upgraded calls from Audio to Camera and Screenshre works with Channel and Mute Icon.

That's how the new mute and associated channel will work.

Working with Salesforce team.

The screenshot displays the Salesforce Service Console interface. At the top, a message states: "You Have Lightning Components Debug Mode Enabled. Salesforce is slower in debug mode. Ask your admin how to disable it, or see [Enable Debug Mode for Lightning Components](#)." The console header includes a search bar, a tab for "Meeting" (selected), and a user profile for "Lilian Zhang".

The main content area shows a record for an "Event Meeting". The record details include:

- Location: Call Lilian about new building construction
- Start: 12/6/2020, 12:30 PM
- End: 12/6/2020, 1:30 PM

Below the record details, there are buttons for "Add LX Meeting" and "Join LX Meeting". The "Meeting URL" is provided as <https://ignite.oraclecloud.com/meeting/RLCBMMGF.a9740874c667dts71042b1963bb8>, and the "Code" is "RLCBMMGF".

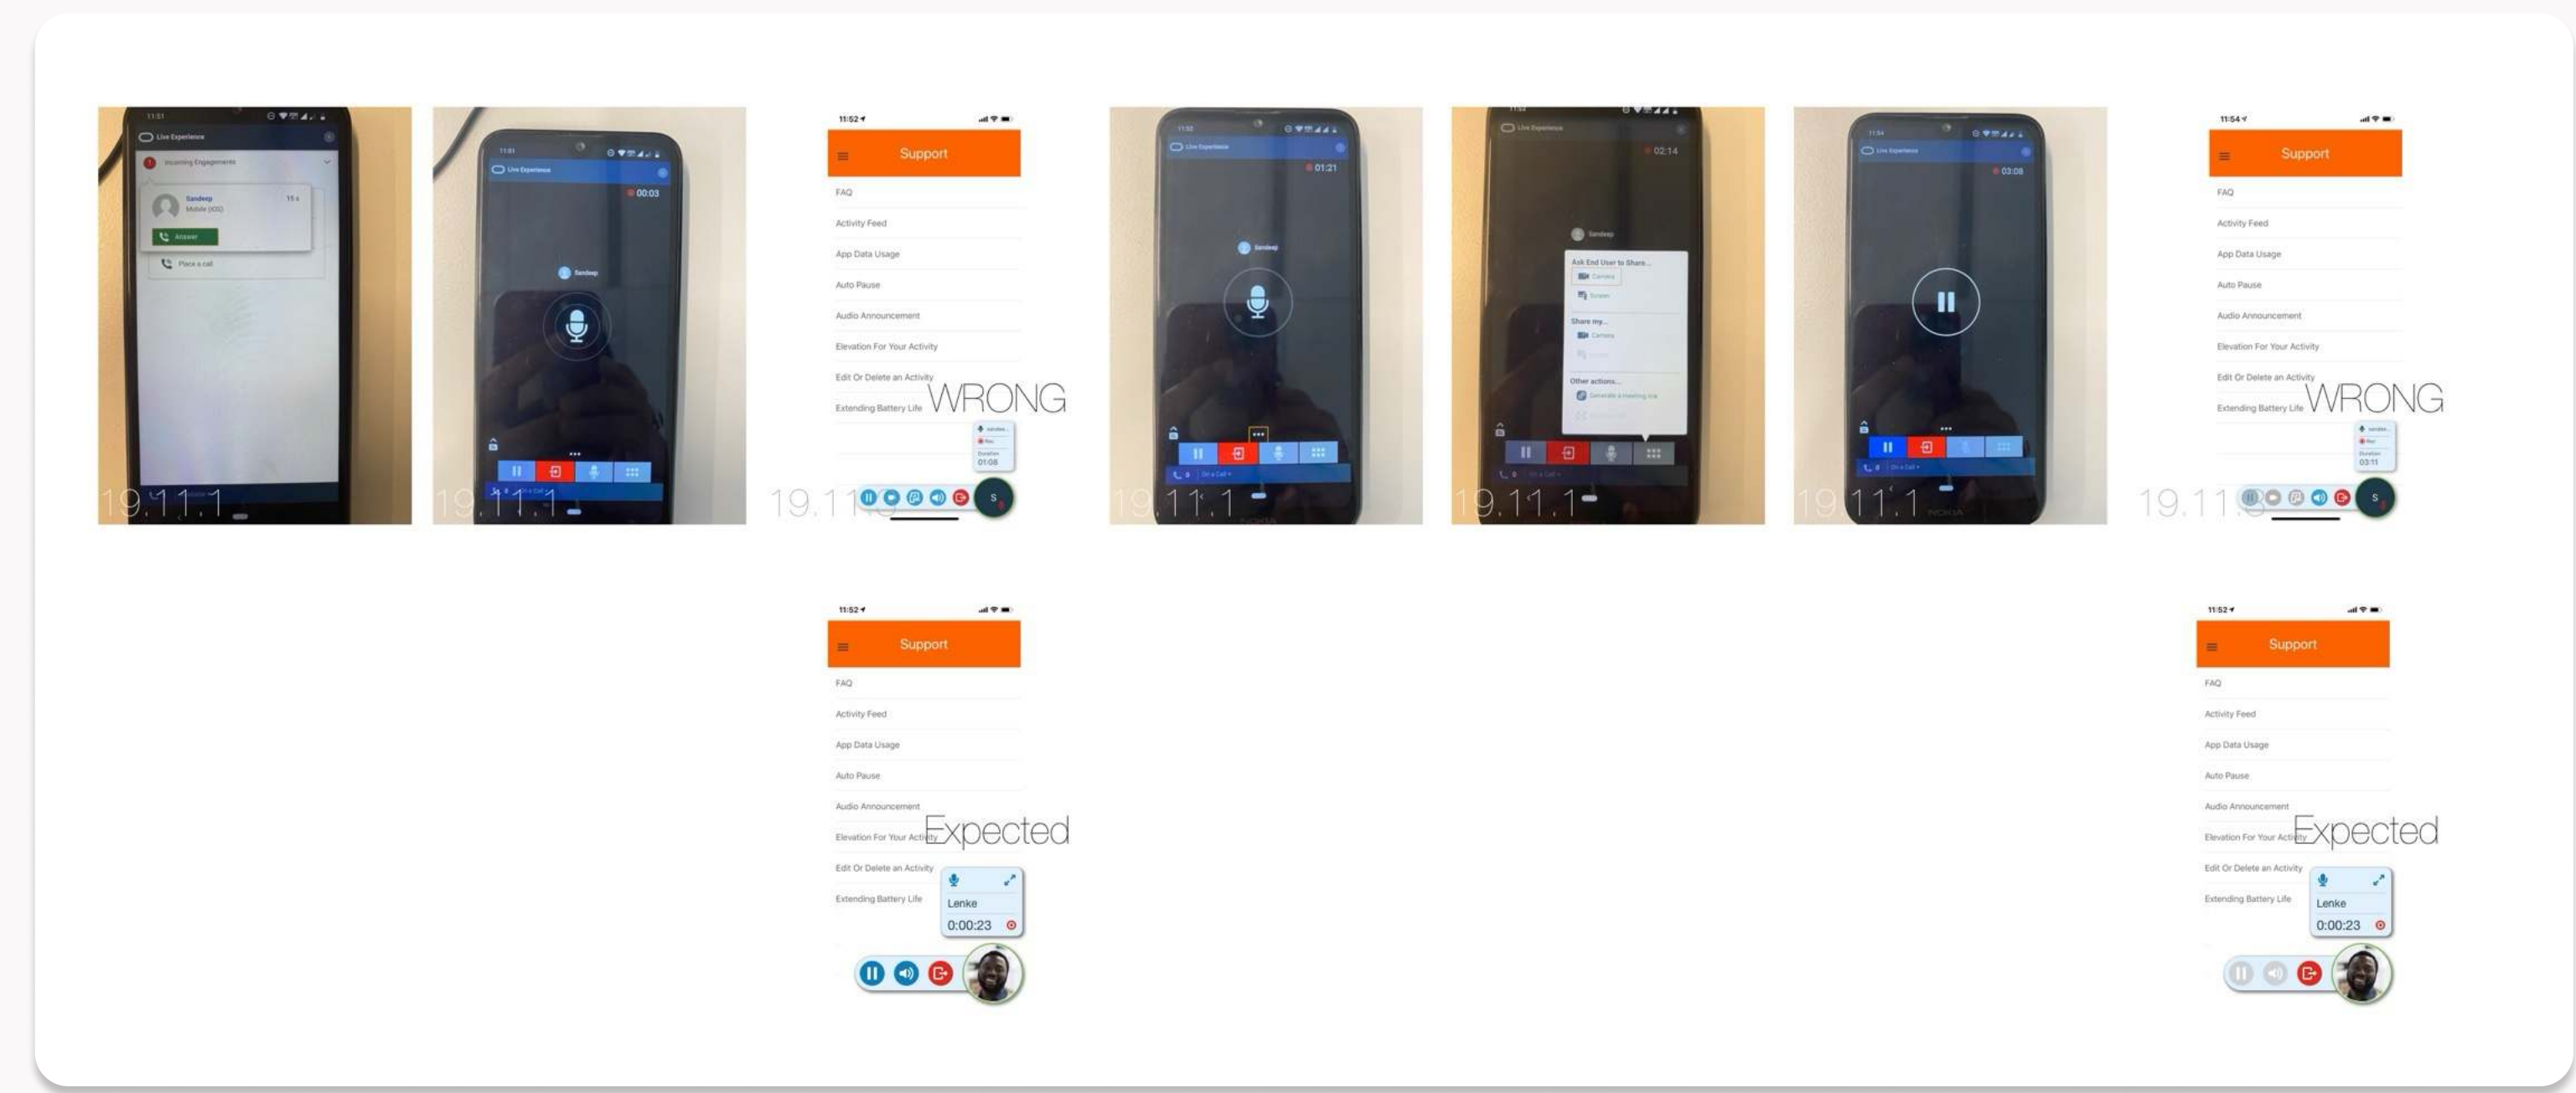

The "Details" tab is active, showing fields for "Assigned To" (Gavin Tiplady), "Subject", "Location", "Start", "End", "All-Day Event", and "Last Modified By" (Gavin Tiplady, 12/22/2020, 4:55 PM).

In the bottom left corner, a "Live Experience" frame is visible, showing a video call with "Joe Bloggs". The frame includes a timer at 0:32 and a "On a Call" status at the bottom.

In the case or for example end-user video, maybe full screen and maybe not depending on lots of other conditions ie parameters passed through to always show the end-user video in full screen but irrespective of it being full-screen or not, once we start sharing the screen unless we hide the end-user video panel we are always going to be showing the end-user video panel if it is in full screen-share or a portion of it if it the end-user video is a thumbnail.

{ Sample Screen as tested by the user experience designer for the mobile experience }

The underlying question is, and for the meeting-web-app we should never allow screen-share when sharing the end-user video as the video on the end-user side is always full screen by requirements so it never makes sense, but for the none meeting-web-app case ie web-widget hosted in a web-page or for the mobile-widget hosted in a mobile-app why would we ever want to share the screen after sharing the end-user video or sharing the end-user video after sharing the end-user screen....mixing those use cases just seems wrong and very unlikely but it does cause confusion.

Sharing the associate video and associate screen-share simultaneously is a different discussion.

UX Testing: When the end-user video is displayed instead of screen share.

Maintaining Design System
