

Case Study

Oracle Unity Data Platform

Unity Data Platform, Business Goal

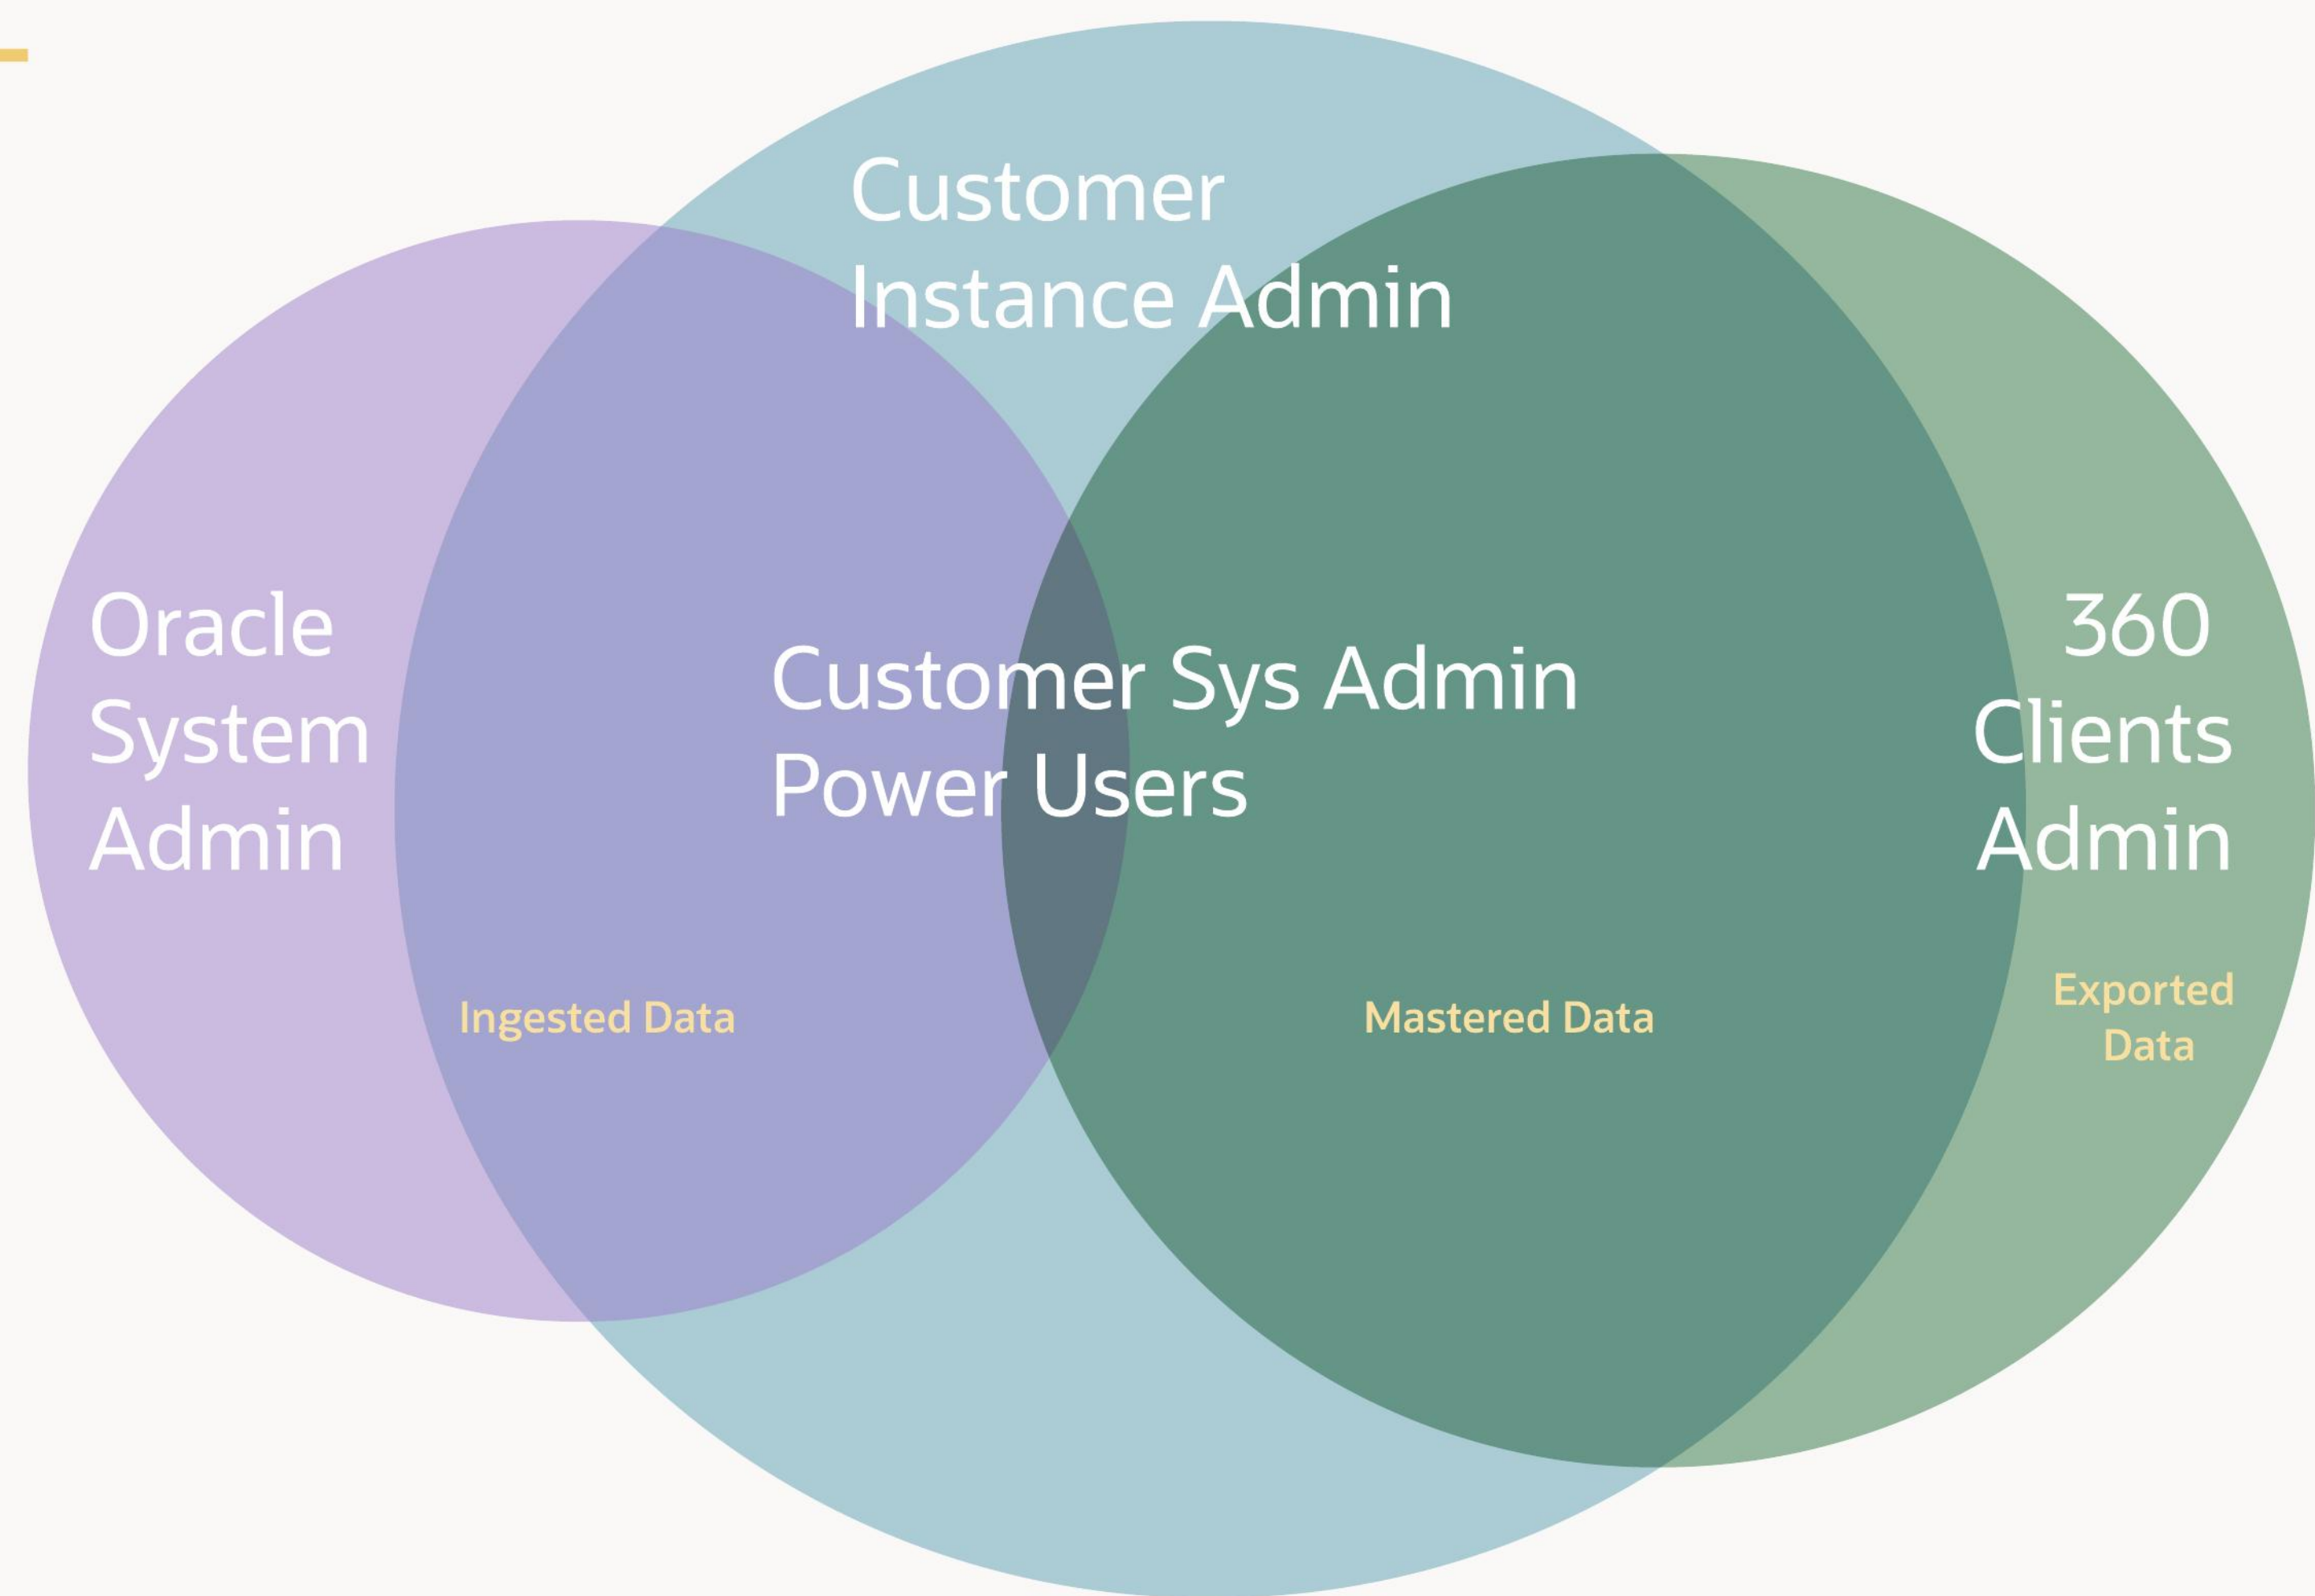

Unity Data Platform is a **massive data aggregator** and **processor** application.

It gathers disparate data from internal and external sources, does advanced analysis, augments, **cleans**, and **standardizes your data**, and then **rewrites** it into logical tables so that you can consume it.

UDP provides a highly **customizable platform and framework** to meet the most specific business needs. (Oracle, Data Warehouse Cloud)

Sponsor Users: **Internal IT Administrator**

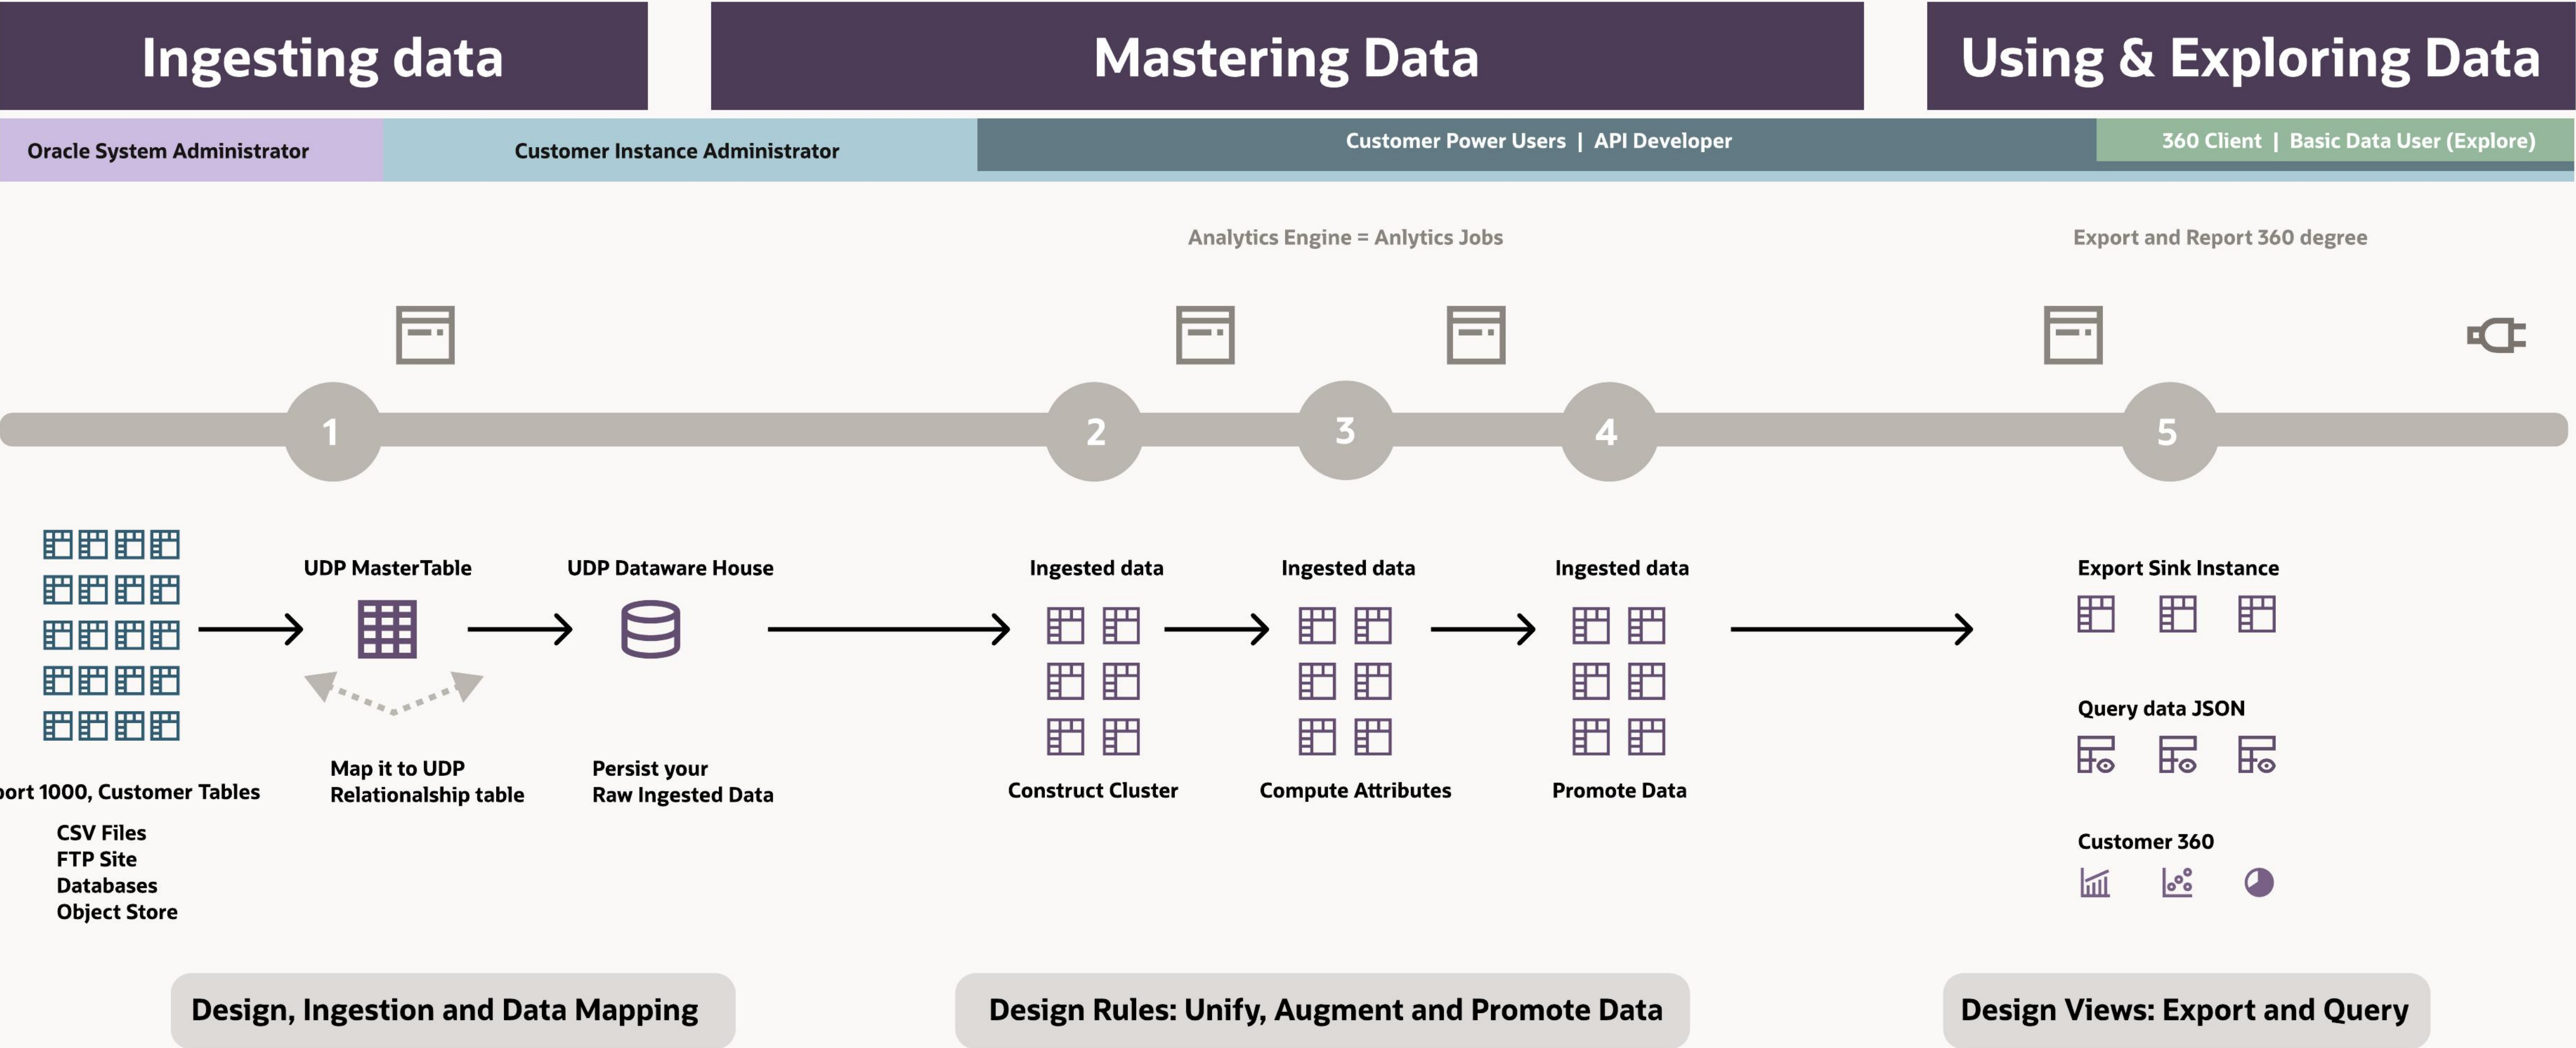

Technical Personas

- Provision the Service
 - Setup Tenants and Users
 - Configure Customer Metadata
- Provision the User
 - Administrative access to customer Tenant
 - Configure Customer Metadata
 - Configure Tenant Metadata
 - Query Data
 - Run Jobs
- Configure Customer Metadata
 - Query Data
 - Run Jobs
 - API Developer | Power User
- Run and Export DW Jobs
 - Filter and Query Data
 - Lookup Unified Customer Records

Understanding the user journey at 30000 feet

Understanding the existing structure - A developer's tool

JSON Tables

What was needed ?

Design the Admin Console with Redwood Style Guide

1. Navigation System and Labelling
 2. Getting Started Flows
 - 3. View, Edit and Create pages**
 4. Brand the Query Builder
- 
1. Injest Tables
 2. Aggrerated Attributes
 3. Cube and Models
 4. Promotion Rules
 5. Clustering Rules
 6. Data Source Viewer
 7. 360 Explore View

My journey - solving key challenges

- A very **technical product**, as this was an internal application, the timelines for the delivery was in a crunch and had to coordinate with the development team in the U.S.
- I had to spend a lot of time **learning JSON** and understanding how objects and arrays are used to define the attributes for any new table.
- I spend a lot of time learning and understanding how to create complex **IF, AND, OR** complex rules and filters for our flows.
- I took the self-initiative and coordinated with multiple members of the Redwood Design Team to get the flows and **design reviews** and enhanced my mocks.
- Also kept the focus on the **Live Experience** product deliverables.

Requirements

Navigation and Labeling

Solving: Navigation and Card Sorting

21.5 User Experience Components Anatomization - Unity Data Platform

Created by Sandeep Vymani, last modified on May 13, 2021

The Design Process

As of May 12, 2021, **Oracle Unity Data Platform** is going through an important phase of user experience updates. The product is very stable with clear functionalities, but this chapter is written to update all the stakeholders on the **components** belief and the process which went behind the scene in creating these components. Let's take a quick snapshot of the same and discuss the same in details.

We started the project in the summer of May 2020, and at that time we had a very basic understanding of the **Information Architecture** of this product. It was all about many JSON tables and converting the same to a workable GUI. Under the guidance of the product management team gradually started mapping the pieces together and understood the flow of the system. We had many rounds of meetings and recordings to get the depth of the product and how each piece of the puzzle is connecting.

The decision to go with a simple **View**, **Create** and **Edit** format started making sense to the products Information Architecture.

The Design Components					
There is a meaning and a use-case for all the design components used in the product. The User-Centric approach and ease of use were the mantra applied carefully with taking the personas into account for the System Administrative, Instance Administrative, Power Users, and Client Views.					
Number	Component Name	Visual Reference	Design Thinking and Usage	Status	Note
1	The Show and Hide Menu		During the Redwood Design review	Implemented	
2	The Shell Header		The Shell or you call it the Spectra Shell which is used for a non FA component is widely used to support the application form pages with a consistent Oracle Brand Header. Usage: We used it because we understood, that customers who opt out of "Ask Oracle" by using a custom theme instead of Redwood will see the global header on all the Spectra Pages. Although this is part of Redwood, this was used as a custom theme before Ask Oracle. Currently, we want to maintain these same for the product.	Implemented	
3	Publish		Part of the Shell or you call it the Spectra Shell which is used for a non FA component is widely used to support the application form pages with a consistent Oracle Brand Header. Usage: <i>Publish</i> icon represent the data being written to the Data warehouse and the Icon represents the same merging distinct tables to the directory. We went through designing different icons and a few ideated as exit and a few were meaningless till I went with Mohit's suggestion of getting this updated. I agree with the concept now. Avatar is the extension of the navigation strip	Implemented	
4	Avatar		Avatar is the extension of the navigation shell header and has its own functionality. Currently, it supports the sign-out but it has extended functionality that needs to build upon. The cube block represents the redwood styling and the picture of the user. The new avatar is part of the redwood block OJET stripe. Usage: A dropdown component that holds the functionality of the product, that needs to build upon as we progress in a flexible manner.	PIM: In Progress
